

# Procedure

## Cure for Covid-19

This week I would like you to get creative. While scientist around the world are searching for a cure for the Corona Virus, using a range of specific scientific methods and numerous medicines that have long names that we would struggle to pronounce, I would like you to create your own cure or vaccine.

Be creative with this task, as I know I wouldn't be able to create an actual cure. I could create an idea that would help to cure people of any loneliness or sadness that they may be feeling at the moment.

My cure could be an elixir created with ingredients from my cupboard that would need to be drunk in order for it to start working. You could include super foods like blueberries and kale as the ingredients for a drink or smoothie.

It could also be an idea that uses abstract nouns as the ingredients. You could use a touch of laughter and a load of happiness as the materials needed to be used daily to defeat the virus.

Maybe you could blend ingredients together to make a cream that could be applied to the skin.

Whatever your cure, make it creative and if you can, try making it. I would also like you to write out this process in the form of a procedure. Think about how we would write up an experimental procedure in Science.

Make sure that you ask for parent's permission before using any kitchen appliances like a blender. And ask before you use all of the ingredients in the cupboard and/or fridge.

# Challenge

Create some branding for your cure. Imagine that you would be selling this to the general public.

How would you package it?

What would your slogan be?

What colours would you use to design the packaging?

Are there any warnings before use?

Do you include instructions for use?

I would love to see any ideas that you come up with so if you can, send your work by email to the school office so that we can have a look.
