

PRODUCT OVERVIEW

AXON is an integration orchestrator, allowing the creation, modification, and management of referential and transactional data integration workflows between multiple applications and systems, whether real-time, scheduled or manually triggered. Using pre-built or customised connectors, AXON is technology independent, utilising web services, database queries, and lower-level communication protocols such as TCP/IP or UDP, between any application or system whether on-premise or cloud based.

AXON provides an easy to use interface where connectors are registered and managed, and where transactions are fully audited and monitored. Alerting features allow users and administrators to be informed of exceptions or when human intervention is required. AXON also provides real-time live monitoring of data streams and is able to trigger alerts and data update actions based on events captured from those data streams.

KEY FEATURES

- » Solve typical integration issues whether on-premises or cloud-based
- » Support real-time or batch integration
- » Ensure data consistency across the organisation
- » Maintain full traceability of events and exceptions
- » Issue reports and view data graphically
- » Define and automate the actions needed for verification checks
- » Manage and automate alerts and transfer of information to connected systems
- » Extend the lifetime and accessibility of legacy applications

FULLY AUTOMATED

Business processes are consolidated and span the organisation regardless of the nature or location of the specific systems. Data is consistent, giving users a single version of the truth.

SEAMLESS INTEGRATION

Management gains confidence in their applications with one integrated system that includes mobile, social, cloud-based, and all the enterprise applications that your users are accustomed.

RAPID IMPLEMENTATION

Quicker implementation helps the user focus on the business content passed across systems and spend less time dealing with complex systems.
