

MagnaClean Filtration System

If you are experiencing problems with your central heating system, such as cold spots in your radiators or low heat levels, then your system may be clogged up with sludge.

Sludge is formed from a natural build-up of black iron oxide which will quickly impair heating system performance, eventually causing boiler damage or breakdown.

MagnaClean is a magnetic filtration system which will protect your heating system by capturing and trapping contaminants before they reach your boiler. Without sludge in your system, hot water is able to circulate more efficiently, flowing at a higher rate, which means you won't need to use as much energy to heat up your home.

When we install a new boiler, we strongly recommend that you have a MagnaClean filter installed as a matter of course - to ensure that your new boiler is fully protected.

If you have been experiencing cold spots in your radiators, then we also recommend a full-house MagnaCleanse. Unlike a normal power-flush, a MagnaCleanse provides a deep clean for your entire heating system. The procedure takes about a day to complete and will leave your heating system working at maximum efficiency. The filter is then serviced annually.

Take a look at the pictures below which show the central magnet of a MagnaClean filter before and after flushing just a single radiator. These were taken by us at a Harpenden home.

Central magnet before cleaning

After cleaning just one radiator
