

Iridology

The art and science of the color and structure of the iris to determine tissue weakness and the body's predisposition to weakness. The first documented reference to iris analysis can be credited to the physician Philippus Meyens, who wrote the book called "Chiromatica Medica", published in 1670, which described the reflective features of the iris. In America, a chiropractor, Dr. Bernard Jensen, is hailed as the most accomplished Iridologist of recent years and is known for his healing philosophy and writings in the area of Iridology. He is considered the Godfather of Iridology in America. The science of Iridology is not used for diagnosis. Only Medical Doctors have permission to diagnose.

Iridology shows the potentiality of the body and the degree of vitality of a gland, organ or system. It is a tool for assessment. What we can see in the iris: Tendencies, Possibilities, and Potentials.
