

Trolley maintenance

The trolleys produced by Robertson Harness are made from stainless steel, with the exception of the sheaves. The sheaves are made from 56-58 Rockwell case hardened steel. These sheaves cannot be exposed to the elements without severe erosion and damage to the trolley. There is no defined life span of a trolley. Retirement is based on the condition only. To ensure the life of your trolley, there are some steps you can take to care for your equipment.

Cleaning and care:

For daily maintenance, insure the trolley is free from dust and debris. If the trolley is wet take the time to dry completely. If your trolley is exposed to salt water during daily use, it should be rinsed with fresh water and completely dried off. No trolley should be left outside to face the elements on a day to day basis; all trolleys should be taken down and properly maintained.

Trolleys are built for their endurance and performance and will need to be properly maintained and cared for. If the trolley has debris stuck anywhere within it, try to remove it using a toothbrush or cloth. Follow with a rinse and a through dry of the hardware. To maximize the life of your trolley, Robertson recommends using a dry or non-sticky lubricant after cleaning.

Any further questions about trolley maintenance feel free to call Robertson Harness at 970-682-4470 or email @ sales@robertsonharness.com
