Decreasing Your Risk

Seconds Count in an Emergency

THE HIGHEST RISK found when Riskboss conducts Comprehensive Risk Assessments in residential and commercial towers is the lack of reception for cellular phones, radios and medical alert devices in underground garages and other critical areas. It's not about improving cellular phone connectivity for general use. It's about getting connectivity when you are in a panic because of a medical emergency or when feeling threatened and you need help right away.

Riskboss has a risk-free solution – Riskboss Boost™

Seconds count in emergencies

The last thing you need in an emergency is to be unable to find a panic call station in the underground garage or being unable to call 911 for help. Even if you find and are able to get to a panic station, it is generally unknown that localized audible alarm stations found in most underground garages are not connected to live operators that can coordinate assistance and response to aid people in need of help.

Often underground garages contain panic alarms that when pressed, route the signal to the security desk; however, more often than not, the security guard is on patrol or dealing with some other issue and will not be available to help anyone.

There are no regulatory or government requirements for installing such systems that mandate third party monitoring in underground garages and other critical areas such as there is for elevators.

The unfortunate reality is that in most cases when you press an emergency underground panic button, help is not coming.

Riskboss Has a Risk-Free Solution

Riskboss Boost™ provides CPR to your underground garage and other critical areas

C P R Cellular Phone Reception

Cellular phones, radios used by security guards and emergency responders such as police and ambulance, and medical alert devices do not work in underground garages especially in lower levels due to heavy gauge construction materials that impair signal transmission. This creates a very high risk to everyone.

Dependable communication in underground garages and other critical areas is a must for people in need of help during a medical crisis or when trying to call 911 during emergencies.

Building Superintendent Radios	✗	✓

The Riskboss Boost Program

The Riskboss Boost Program (Riskboss Boost™) has been created exclusively for residential and commercial underground parking garages and other critical areas to eliminate the risk of dead zones for cellular phones, radios and medical alert devices.

Dead zones are not just limited to underground garages in some towers due to environmental and structure issues. Reception in such critical areas as swimming pools and fitness centers where signals are jeopardized are required for emergencies

Unlike other remedies that simply install amplifying or repeater devices that may eventually fail due to mechanical flaws due to a lack of servicing, Riskboss Boost™ ensures constant monitoring of the frequency systems in underground garages and other critical areas so that when you need a signal, it is always there.

The Riskboss Boost program consists of the following:

- ✓ On site analysis by highly accredited technicians
- ✓ Analysis of on site vulnerabilities
- ✓ A menu of recommendations to clients
- ✓ Installation of state-of-the-art hardware & software solutions by certified technicians
- ✓ Ongoing monitoring and support
- ✓ Extended warranty and service options
- ✓ Financial plans that meet every budget

All residential and commercial towers have structural qualities that require tailor-made and unique solutions. Using a cookie cutter approached to eliminating such risk is never recommended. Contact Riskboss for a free no obligation quote and eliminate your risk today.
