

Chorus Analyse

Cleanse, Combine and Connect

Expert Cell Site Analysis

Chorus Analyse allows you to cleanse, combine and connect call data records and other digital data to answer key investigation questions and generate courtroom ready reports.

Any Data Type

Chorus Analyse has the ability to ingest all forms of digital data. From communications and ANPR data, to RF survey data and handset downloads, Chorus Analyse can cleanse and format them all. It also has the ability to overlay each data type in one customisable dashboard to help you spot links and get answers.

Time Saving

Business cases developed by Police Forces have demonstrated time savings of 97% and a full return on investment within 40 days. Investigation teams are able to achieve higher detection, enforcement and conviction rates.

Custom Cleansing

Automated cleansing rules can process up to 10 million rows of data quickly and efficiently to remove duplicates and associated noise from communications data. The rules also format your data for consistency and validate locations and device information for accuracy.

Visualisation

Chorus Analyse can visualise data to help spot connections and get answers from data using its intuitive dashboard. Timelines, maps, heat charts and a matrix are all fully interactive with the ability to drill down into data using filters and custom searches.

Evidential Reports

Over 40 customisable reports can be generated in a few clicks and used evidentially. Maps and charts are also produced to a courtroom standard. A full and robust audit trail gives you confidence to know exactly how Chorus has processed your data.

Integrations

Cleansed data can be exported at any stage from Chorus into an Excel format. Chorus also integrates with other software including **i2 Analyst's Notebook and iBase**, and **ESRI** mapping to enable further interrogation of the data.
