To Whom It May Concern:

For the last several months we have worked with Gedalia Vinokurov of GV Designs, LLC on a very complex project to upgrade our hospital facilities. The primary object of this work was to create additional space and improve the mechanical facilities and energy consumption of the existing building. In a very short time Gedalia came up with expert solutions to all of our priorities.

These improvements were wrapped in a unique architectural envelope that added great interest to the building's exterior image. On the practical side, the proposed mechanical and electrical systems, especially the use of solar energy, will greatly reduce our operating and maintenance expenses. As an example of this the expected Solar Power Station capacity for the renovated hospital was about 400.0kW. Gedalia's design raised this capacity to 4,8MW.

If your program is to achieve greater utilization of building space and parking, pleasing exterior and interior design, and vastly better energy use, we do not hesitate to recommend Gedalia Vinokurov and GV Designs as the Company to execute this work.

Warm regards,
