Lyme Disease

Quick Help

If you think your child has Lyme Disease
Inspect children’s skin and scalps after possible tick exposure.

Need to stay home?
No.

Prevention

- Avoid tick habitats (eg, tall grassy areas, bushes, wooded areas) if possible. Walk in the center of trails to limit brushing against trees, bushes and high grasses.
- If children will be in tick-infested areas, dress them with hats, light-colored clothing, long sleeves, long pants tucked into socks and closed shoes.
- Spray permethrin on clothing to prevent tick attachment. Apply the spray to the clothing when it is off the child in a well-ventilated area outdoors. Some clothing comes from the manufacturer permethrin-treated.
- **DO NOT USE DEET IN CHILDREN YOUNGER THAN 2 MONTHS.**

Lyme disease is an infection caused by a bacteria that is transmitted when particular types of ticks attach to a person’s skin and feed on that person’s blood.

Symptoms
- Gradually expanding, large, circular or oval-shaped rash with central clearing that appears after a tick bite.
- Fever
- Headache
- Mild neck stiffness
- Flu-like symptoms

Spread
When infected ticks attach to and feed on humans long enough (more than 36 hours).

Contagious Period
Lyme disease is not contagious.

Call your Healthcare Provider
- Lyme disease is treatable with antibiotics. Consult with your physician if you begin displaying symptoms or have had tick exposure for an extended period of time (36 hours or more).
