Viral Meningitis

Quick Help

If you think your child has Viral Meningitis

Tell your childcare provider or call the school.

Need to stay home?

Yes, until fever and/or diarrhea is gone and your child is healthy enough for routine activities.

Prevention

- Cover nose and mouth when coughing or sneezing. Use a tissue or sleeve. Dispose of used tissues.
- Wash hands after touching anything that could be contaminated with secretions from the nose or mouth or with stool. Your child may need help with handwashing.
- Never share drink containers and cups of silverware. Wash all dishes with hot soapy water between uses.
- Clean and disinfect any objects that come in contact with the nose or mouth or with stool (especially mouthed toys). Use a product that kills germs.

Viral meningitis affects the thin lining covering the brain and spinal cord. It is usually caused by enteroviruses.

Symptoms:
Your child may be unusually tired and suddenly have a fever, headache, stiff neck and/or rash. Other symptoms may be sore throat, diarrhea and vomiting. It is hard to tell if babies have viral meningitis. Babies with the virus may have a fever. They may also be fussy, refuse to eat or be difficult to wake. If your child is infected, it may take from 2 to 21 days for symptoms to start. It usually takes 7 days.

Spread
- By coughing or sneezing.
- By touching contaminated hands, surfaces or objects. Stool from infected people can also carry the germs.

Contagious Period
For 3 days before until 10 days after symptoms start. Virus may be in the stool for several weeks.

Call your Healthcare Provider
- If anyone in your home has symptoms. Your doctor may want to test for the virus.
