Pertussis (whooping cough) can be a serious bacterial illness, especially in young, unvaccinated children.

Symptoms:
Your child may first have a runny nose, sneezing, mild cough and possible fever. After 1 to 2 weeks, your child may cough in explosive bursts. These coughing attacks can end in vomiting and/or in a high-pitched whoop. Coughing attacks occur most often at night. This may last up to three months. If your child has been infected, it may take 4 to 21 days (usually 7 to 10) for symptoms to start.

Spread
By sneezing or coughing.

Contagious Period
From the time of the first cold-like symptoms until 21 days after coughing begin. Antibiotics shorten the time a child with pertussis can give it to others.

Call your Healthcare Provider
- If anyone had a cough 14 or more days. Laboratory tests may be done. Antibiotics will reduce the contagious period, but may do little to relieve your child’s cough.
- If anyone has been exposed to pertussis. Also, if public health has recommended that antibiotics are needed because of an exposure.
