

SEA KELP MEAL OCEAN FARMED

Our Kelp Meal is ocean farmed, preserving natural coastal kelp beds while addressing the two biggest threats to life in the seas: acidification and excess nutrient loading

Ocean acidification, negatively impacts sea life when excess carbon dioxide migrates from the air to the water. Kelp uses the greenhouse gas at five times the rate of land-based plants, helping to mitigate acidification.

Fast growing kelp also mines the water of excess nutrients and pulls nitrogen *out* of the ocean. Our harvesting location is open sea in waters considered ecologically protected.

The kelp farm operation is the largest *food grade* sea kelp production grown on lines.

The meal is sun dried and transported to the factory for packaging.

Growing beds are not located near sources of chemical or bacteriological contamination.

We provide this material by full container loads
