

Chorus Capture

Internet Intelligence and
Investigation

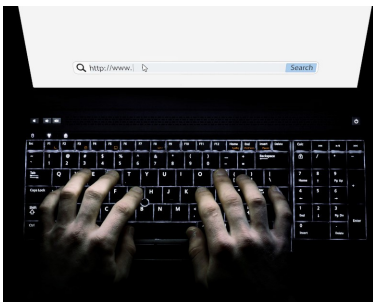

Capture Anything, Anywhere

Chorus Capture is a RIPA and MOPI compliant internet intelligence and investigation tool. It gives Investigators the ability to capture any data, anywhere online and store it in a secure digital hub.

Evidential Capture

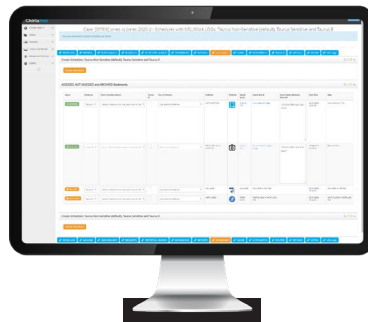

Search across all web pages and social media platforms to capture relevant pages and information in an evidential format. Keep a log of all URLs visited to maintain the integrity of the research and capture evidential paths.

Automated Surveillance

Conduct perpetual surveillance by subject of interest or URL.

Create watch lists for cross-matching and set up automated email and phone alerts to ensure nothing gets missed.

Non-attributable

A non-attributable network from your desktop, laptop, tablet or phone. The freedom to use any browser at any time and the power to choose when to reveal and hide your identity.

Redaction

Use robust redaction to protect the integrity of alias accounts and prevent collateral intrusion when conducting investigations. Capture full pages and crop using blur or blackout tools within the application.

Built-in Compliance

Automatically generate intelligence reports and exhibits. Capture is fully compliant with MOPI standards and CPIA disclosure with auto-generated MG6 series documents. It also has the ability to extend and reduce the lifetime of captured evidence.

Advanced Data Capture

All captured data is virus checked and stored in a read-only format in the Hub.

Raw HTML capture allows for immediate indexing and advanced analytics of the data by using Chorus Ivy to enhance usernames, links, and emails.
