Bone and/or Joint Imaging; Tomographic (SPECT)

Clinical Information:
Chronic progressive neck pain and cervicalgia for several years.

Comparison:
None

Procedure:
Following the intravenous administration of 19 mCi Tc-99m MDP, a SPECT image of the region of interest was acquired after an appropriate delay. Spot planar views of the region of interest were also acquired.

Findings:
Planar Imaging: No abnormal uptake noted in the visualized ribs and shoulders. Normal soft tissue uptake noted.

SPECT Imaging: Mild uptake noted in the right C4-5 facet joint and C5-6 disc space.

Impression:
Degenerate remodeling noted in the cervical spine as described. No acute process identified.
