IN THE MATTER OF

Petition of Steve Rhode for Exemption

Docket Number: FAA-2014-0799

COMMENTs OF THE SMALL UAV COALITION

Introduction

The Small UAV Coalition\(^1\) is pleased to provide its comments in support of the petition for exemption submitted by Steve Rhode ("Rhode") under section 333 of the FAA Modernization and Reform Act of 2012 ("the Act"). Rhode proposes to operate one or more small unmanned aerial vehicle and systems ("UAV" and "UAS"), for the purpose of conducting public safety operations for fire, EMS, and rescue services, and also conducting joint operations with law enforcement, concomitantly performing research and development in the operations of his UAVs. Members of the Small UAV Coalition share an interest in advancing regulatory and policy changes that will permit the operation of small UAVs in the near term, within and beyond the line of sight, with varying degrees of autonomy, for commercial, consumer, recreational and philanthropic purposes. Coalition members are concerned with the current pace of regulatory and policy development, particularly in the U.S. but also in other countries, that has impeded and will continue to impede small UAV development, services, and benefits for consumers. We encourage the Federal Aviation Administration ("FAA") to establish, as soon as possible, a regulatory environment for small UAVs that will foster safe experimentation and innovation so that globally important development work and operations can occur here in the U.S.

Although the focus of these comments is the Rhode petition, the Coalition recognizes that UAV policy in the U.S. may have ramifications worldwide. There are many UAV manufacturers outside of the U.S. who are, or soon will be, ready to market their products and services in the

\(^{1}\) Members of the Small UAV Coalition include 3D Robotics, Aerialtronics, Airware, Amazon Prime Air, DJI Innovations, Google[x] Project Wing, GoPro, Parrot, PrecisionHawk, and SkyWard IO.
U.S., and many U.S. corporations have expanded their small UAV development activities overseas. Moreover, other countries may follow or adopt U.S. regulations or policies for their domestic UAV operations. It should be a U.S. policy imperative, therefore, to foster innovative UAV technologies that promise consumer and public benefits, as soon as safely possible. The FAA should continue to work expeditiously to implement its section 333 authority with these policy considerations in mind. Reasonable regulations, waivers and exemptions, with safety, security, and privacy as their foundation, will encourage domestic and international UAV opportunities.

Because of their size, weight, speed, and the altitude at which they will typically operate, small UAVs such as the one to be operated by Rhode pose considerably less safety risk than larger UAVs. The Small UAV Coalition urges the FAA to adopt an evaluation framework for UAV operations under section 333 that weighs the relative safety issues and risks of UAVs.

The Rhode Petition

As noted above, Rhode seeks FAA permission to use one or more small UAVs to conduct fire, EMS, and rescue services, and other operations on behalf of law enforcement (but not for any law enforcement surveillance activity, according to a supplemental filing by Rhode). Although Rhode’s proposed small UAV operations may pose no greater risk than small UAVs that are used by hobbyists and modelers (because of weight, altitude, etc.), Rhode has proposed to abide by much stronger safety measures than are required for these groups. The Small UAV Coalition does not believe that heightened safety measures should be required for Rhode simply because of the commercial nature of his operations. Small UAVs that operate for any purpose, commercial or non-commercial, should be judged based upon the precautions taken for safe operation, taking into consideration the relevant technical parameters of the UAV and UAS.

Rhode proposes to operate a battery-powered UAV that will weigh less than 55 pounds (the initial unspecified UAV he will operate will weigh less than 10 pounds), “typically” be conducted below 400 feet AGL within Class G airspace, and in very limited areas, not over crowds or near airports. Rhode states that his UAVs will have an “integrated GPS pilot system, with a no-fly zone programmed to stay clear of controlled airports.” In the event of a loss of communication the UAV will be programmed to return to a pre-determined location; in the case of GPS failure, the UAV will be capable of being manually flown to land safely. Flights will end when battery reserve reaches 25%. Rhode holds a private pilot certificate and has operated UAVs for over 200 flight hours.

The Small UAV Coalition offers the following comments in support of the Rhode petition:

Section 333 directs the FAA to authorize UAV operations that may safely operate in the national airspace system; Rhode’s petition demonstrates safe operations.

Congress gave the FAA authority to determine whether certain unmanned aircraft systems may be operated safely in the national airspace system,2 and listed in section 333 seven factors for the FAA to consider. The FAA is to consider operational risks and steps that can be taken to

---

2 Subsections 333(a) and (c) provide that safety in the national airspace system is the ultimate consideration.
eliminate or reduce such risks. In the view of the Small UAV Coalition, risk should be the
touchstone for any and all FAA rules, waivers, and exemptions governing UAVs.

We recognize that, in implementing the Federal Aviation Act as Congress directed, the FAA
historically has imposed greater requirements on commercial operators than on general aviation.
However, those requirements derive from a legitimate public concern over passenger safety on
manned aircraft that serve as common carriers for public transportation, and do not apply to
operation of small unmanned aircraft, such as the UAV operations proposed by Rhode.

Unlike the model aircraft concept defined in section 336, the FAA’s safety evaluation of UAV
operations does not hinge on whether the operation is public, commercial, recreational or
philanthropic.3

The Small UAV Coalition also wishes to respond to comments filed by the Air Line Pilots
Association (“ALPA”) in other section 333 exemption dockets, in which ALPA argues that all
aircraft, manned and unmanned, in the National Airspace System (“NAS”) “must operate to the
same high level of safety.” This position is at odds with the explicit direction by Congress in the
Federal Aviation Act,4 that the FAA promulgate safety regulations considering “(A) the duty of
an air carrier to provide service with the highest possible degree of safety in the public interest,
and (B) differences between air transportation and other air commerce.” Requirements imposed
on common carriers for air transportation under Parts 121 and 135 are much more stringent that
requirements imposed on general aviation under Part 91. Certainly requirements may differ
depending on whether a UAV will be operating in Class G airspace or controlled airspace.
Manned aircraft are currently subject to different requirements based on the airspace in which
they are operated. Here, Rhode proposes to operate his UAV below 400 feet AGL within Class
G airspace. These and other precautions should be more than adequate to ensure safe operations
by Rhode.

While the Coalition is committed to ensuring the safety of small UAV and UAS operations in the
National Airspace System, we believe FAA safety regulations should be proportionate to the
risks posed by the particular UAV operations proposed, distinguishing small UAVs from other
UAVs. Small UAV operations, such as those proposed by Rhode, pose minimal risks to safety
and should, therefore, be subject to minimal and appropriate regulations.

When evaluating the Rhode petition, the FAA should consider the seven factors Congress
directed the FAA to consider, but the FAA should recognize that this list is not exhaustive or
requisite.

As Rhode’s petition shows, factors other than the seven factors set forth by Congress in section
333 are relevant. In section 333, Congress directed the FAA to consider the following when
making section 333 determinations: size, weight, speed, operational capability, proximity to

3 Although Congress in section 336 limited the special rule for model aircraft to aircraft “flown for hobby or
recreational purposes,” the FAA need not and should not apply a commercial/non-commercial distinction in its
small UAV rulemaking under section 332 or when considering petitions for exemption and other requests under
section 333. All regulations and policies with respect to small UAVs should be safety and risk-based, taking into
consideration size, weight, speed, altitude, etc., and this approach should be taken in evaluating Rhode’s petition.
4 49 U.S.C. 44701(d) and 44702(b).
airports, proximity to populated areas, and operation within visual line of sight. But in the words immediately preceding this list, Congress stated that the FAA is to consider these factors “at a minimum.” The FAA may consider additional relevant factors not enumerated in section 333, including some factors that are addressed in Rhode’s petition, such as: location, the altitude of his small UAV operations, and his extensive experience operating UAVs.

Each of the seven identified factors identified by Congress is potentially relevant to the FAA’s safety risk determination, but not all of these factors are a prerequisite for every exemption. In its recent grant of exemptions to Astraus Aerial and other petitioners, the FAA has determined that operating within the visual line of sight is a statutory mandate under section 333. We disagree. If Congress intended any factor in section 333 to be a requirement, it would have mandated such restrictions by law, as it did in section 336 (with respect to model aircraft) and section 334 (with respect to certain public agency operations). While relevant in evaluating safety risks, FAA should not interpret section 333 as prohibiting operations beyond the visual line of sight in every case.

It is incumbent on the FAA to evaluate each factor within the context of the applicant’s proposed UAV operations. Consider the factor of weight. Congress did not provide a weight (or size) limit for model aircraft, and provided that a small UAV (for purposes of the small UAV rulemaking under section 332) could weigh up to 55 pounds (section 331(6)). Congress did not provide a weight (or size) limit in section 333. Whether the weight of the aircraft poses an undue safety risk will depend on the facts and circumstances of the particular UAV operations: altitude of operation, airspace for operation, and geographic area. In Rhode’s case, the weight of the UAV he will initially operate is less than 10 pounds. Considering the altitude and controlled areas in which his small UAV will be operated, and other precautions to be taken, Rhode’s UAV operations will not likely pose a safety risk to other aircraft, national security, or persons on the ground.

Other factors the FAA may consider include speed and proximity of UAV operations to airports and populated areas. With respect to speed, the relevance of this factor depends on the facts and circumstances of the particular UAV operations. The speed of a UAV operating in the same airspace as commercial aircraft operations is a legitimate safety factor. However, the speed of a UAV operating below 400 feet AGL should be evaluated with respect to safely maneuvering, detecting and avoiding. Rhode’s small UAVs will travel at no more than 50 miles per hour, and the operations covered by this petition will take place below 400 feet AGL. Thus, these operations do not create any safety risk that is not more than adequately mitigated.

The proximity of UAV operations to airports and populated areas are also relevant factors. There are over 19,000 airfields in the United States; of these, only 5,000 or so are public use airfields. Over 3,000 airports are listed in the National Plan of Integrated Airport Systems, but only 500 of these have commercial service. The safety risk of a UAV operating close to an airfield that is not public is appreciably less (and easily managed) compared with UAVs operating proximate to commercial service airports such as John F. Kennedy International Airport or Chicago O’Hare International Airport. Rhode states that his UAV will be programmed to stay clear of controlled airports; he does not address non-controlled airports.
The risk of UAV operations that are close to populated areas is highly dependent on the specific facts and circumstances. Congress did not define “populated area” and it is not apparent that this concept is the same as or similar to the concept of “congested area” in 14 C.F.R. 91.119. Similar to the concept of shielding (used in determining electromagnetic interference), tall buildings or structures between airports or populated areas and the proposed small UAV operation may allow a small UAV to operate without a safety risk, despite the operation’s proximity to either. There is often a congregation of people present on a closed set where a UAV will be used for filming; however, the UAV may be operated safely nearby or inside a populated area. Rhode pledges that he will avoid crowded areas, but fire, EMS, and rescue services and law enforcement operations commonly operate in urban environments that might be deemed “congested” areas. However, given Rhode’s UAV experience and the characteristics of a small UAV, Rhode’s operations are not likely to pose a risk to any congested or populated area that cannot be appropriately mitigated.

We believe the relevant factors for the FAA’s UAV evaluation, whether or not identified in section 333, should be viewed through the lens of the particular UAV operations that are proposed in each petition, including Rhode’s petition. In considering whether to authorize UAV operations, the FAA should evaluate and balance these factors using safety and security as cornerstones, not rigidly adhere to a list of factors that may or may not be relevant or important to particular UAV operations. In the view of the Small UAV Coalition, Rhode’s proposed operations satisfy the relevant factors set forth by Congress and several additional mitigating factors that should ensure the safety and security of Rhode’s proposed small UAV operations.

Section 333 permits the FAA to authorize UAV operations without type, production, or airworthiness certification.

Congress expressly vested in the FAA authority to determine the substantive safety requirements to impose on UAV operations under section 333. Congress also left to the FAA the question of how authorizations would be granted pursuant to section 333. It tasked the FAA with determining whether a certificate of waiver, certificate of authorization or airworthiness certification under 49 U.S.C. 44704 should be required.

Rhode’s petition, similar to other petitions, seeks an exemption from the airworthiness certification regulation. He supports this request with an explanation of the performance capabilities of the UAV/UAS he initially will use to demonstrate an equivalent level of safety and warrant an exemption from airworthiness certification. We note that similar small UAV operations, conducted by hobbyists and modelers, are appropriately permitted without such certification.

With respect to pilot training and experience requirements, Rhode relies on his own experience operating UAVs and states in a supplemental filing that the operator will hold at least a current FAA private pilot certificate and will comply with the pilot operating manual provided by the UAV manufacturer.

\^14 C.F.R. Part 21 Subpart H.
The Coalition recognizes the FAA’s position in its recent section 333 guidance that section 333 does not allow the FAA to waive the requirement of a UAV operator to hold an airman certificate. We disagree. Although the requirement for a pilot to hold an airman certificate is statutory, section 333 of the Act instructs the FAA to consider whether to require airworthiness certificates, certificates of waiver, and certificates of authorization, “at a minimum.” Thus, Congress vested FAA with discretion to waive other certificates, including an airman certificate.

Even if section 333 were read not to convey that discretion, the FAA has sufficient waiver and exemption authority in the Federal Aviation Act. Subsection (f) of section 44701 provides the Administrator with plenary authority to grant an exemption from a requirement of a regulation prescribed under subsection (a) or (b) of this section or any of sections 44702-44716 of this title if the Administrator finds the exemption is in the public interest.

The statutory requirement for an airman certificate is section 44703. Even if FAA construes its exemption authority to be limited to its regulations, it certainly has discretion to exempt UAV operators from the requirements of Parts 61 and 67 and develop an airman certificate specifically designed for small UAV operations.

Accordingly, the FAA has discretion to waive or exempt the pilot certification requirement with respect to small UAS operators and should do so. The manifold innovative UAV technologies, particularly for small UAVs, should not be subject to a one-size-fits-all paradigm with respect to pilot certification. Applying manned aircraft pilot certification requirements to small unmanned aircraft is not necessary as a matter of safety, and does not make sense as a matter of public policy. The Coalition agrees with Rhode’s reference to the FAA’s determination in the Astraeus Aerial and other exemptions that a commercial pilot certificate is not required for the operators of UAVs for closed set filming:

[T]he experience obtained beyond a private pilot certificate in pursuit of a commercial pilot certificate in manned flight does not necessarily aid a pilot in the operational environment proposed by the petitioner; the FAA considers the overriding safety factor for the limited operations proposed by the petitioner to be the airmanship skills acquired through UAS-specific flight cycles, flight time, and specific make and model experience, culminating in verification through testing.

The Small UAV Coalition believes this reasoning supports a UAV/UAS-focused training and experience regimen that should obviate not only a commercial pilot certificate but also a private pilot certificate because the training will be focused on the particular skills of operating the particular small UAV and the particular nature of UAS operations. The specific requirements for the pilot in command set out in summary form in the FAA’s grant of exemptions to Astraeus Aerial and other petitioners, (other than the requirement to hold a private pilot certificate and third class medical certificate), are appropriately focused on UAS operations and the particular UAV.
The small UAV rulemaking will benefit from safety determinations made by the FAA under section 333, including making a positive decision on Rhode’s petition in the near term.

The Small UAV Coalition believes the FAA should adopt and propose some of the precedents it sets in granting section 333 petitions as part of the small UAV Notice of Proposed Rulemaking, provided that it exercises proportionality, taking into account specific classes of UAVs, such as the particular characteristics of small UAVs. As we have made clear, the Small UAV Coalition firmly believes that operators will employ different technologies and standards commensurate with the particular capabilities of the UAS and the particular capabilities of the UAV operations. It may be that some technologies and protocols may be generally applicable, but others should be tailored to specific classes of UAV/UAS technology. We encourage the FAA to adopt the broadest and most flexible approaches at this stage to ensure continued innovation of technology and standards that will allow for safe small UAV operations across a myriad of small UAV/UAS technologies and applications.

We also believe that the experience the FAA and the UAV industry gain from UAV operations authorized under section 333, as well as the experience gained at FAA test sites and elsewhere, can improve and accelerate the rulemaking process. Allowing Rhode and other petitioners to begin near-term operations under section 333, with appropriate conditions and limitations, will provide innovators the necessary physical and regulatory space to pioneer technologies and develop viable business models. This experience and knowledge also will allow the FAA to develop the optimal regulatory framework that both promotes safety and supports growth of a very promising industry by allowing the FAA to learn from operations pursuant to section 333 authority and incorporate insights and lessons learned into the regulatory framework. All of this will allow manufacturers, operators and other interested parties to effectively participate in the rulemaking process with real-world data, observations and analysis.

As previously discussed, we do not believe the FAA is required to, and should not, impose a requirement across the board that small UAV operations must be conducted within the line of sight of the pilot in command. The concept used in section 333 is “visual line of sight” with further specification. In its grant of the Astraeus Aerial petition, the FAA required that all operations must be operated within the visual line of sight of the pilot in command. The FAA also requires that operations include a visual observer (“VO”), and added that the “VO may be used to satisfy the VLOS requirement as long as the PIC always maintains VLOS capability. The VO and PIC must be able to communicate verbally at all times.” We do not believe a visual observer should be required for all small UAV operations, but do agree that the presence of one or more visual observers may allow the UAV to be operated beyond the visual line of sight of the direct operator.

As explained above, we also do not believe the FAA is required to impose a pilot certification requirement, and that FAA has discretion under section 333 and subsection 44701(f) to waive this requirement. At a minimum, the FAA should provide an exemption from Part 61 and approve training, experience, and testing regimens that pertain to UAV/UAS commercial

---

7 In section 334, Congress used the term “within the line of sight of the operator.” In section 336, Congress used the term “flown within the visual line of sight of the person operating the aircraft.”
operations, the particular UAV to be operated, the nature of the operations, and the airspace and altitude in which the UAV will be operated.

The FAA has determined that the TSA vetting of each airman who obtains a private pilot certificate satisfies the section 333 criterion that the UAS operations not pose a threat to national security. Congress did indeed focus on the security of UAS operations but did not require any screening or vetting of UAS operators, pilots, or observers. The Small UAV Coalition believes that such a requirement imposes an unnecessary burden and is unduly focused on a pilot rather than the nature of the operations. Regarding the latter, the factors set forth in section 333 should allow the Secretary to determine the security of such operations.

The Small UAV Coalition also does not believe a small UAS operator should be required in all cases to submit a plan of activities to the local Flight Standards District Office. Nor does the Coalition believe that in all cases a Certificate of Authorization ("COA") and/or Notice to Airmen ("NOTAM") be issued. Notifying the FAA, whether it is a FSDO or Air Traffic Control, or both, should be necessary only when there is a potential conflict with manned aircraft operations because of the altitude of the UAV operation or its proximity to airports. Rhode states that in emergency situations there is insufficient time to file a NOTAM.

With respect to operations in proximity of a non-towered airport, the FAA requires the operator to obtain a letter of agreement with that airport management. We believe it is sufficient to require the operator to be mindful of any nearby airfield and knowledgeable about arrival and departure paths; it should not be necessary to obtain an agreement with airport management where the operation will not conflict with the airport’s operations.

**Conclusion**

Rhode’s petition demonstrates that his small UAS operations can be conducted safely with a number of voluntary safety precautions. In the view of the Small UAV Coalition, the FAA should expeditiously grant Rhode authority under section 333. The Small UAV Coalition believes that Rhode’s operations will provide a valuable opportunity for the FAA to advance the Congressional goal of permitting small UAVs to fly commercially in the U.S. safely and in the near future.
We believe the relevant factors for the FAA’s evaluation of the Rhode petition – including several factors we have identified that are not enumerated in section 333 – support grant of Rhode’s petition. The FAA should evaluate and balance these factors using safety and security as cornerstones. The Small UAV Coalition hopes that the FAA will create a regulatory environment for UAVs that will foster safe and innovative experimentation and operations so that globally important UAV development work can occur in the United States.
