## RBC Technologies Profile

---

- **R&D company, focusing on advanced battery technologies**
- **RBC commercializes technologies through licensing and joint venture partnerships**
- **RBC is currently concentrating on innovative, patent pending and patentable, high power cylindrical alkaline technology**

# Primary Battery Consumer Satisfaction

- Good satisfaction for lower power devices
- As replacement frequency increases, satisfaction declines
- Combination of power requirements and duty cycle

# High Power Device Explosion

- Growth of high power devices driving rechargeable cell volume growth
- Primary risks losing the border region, e.g. digital cameras, MP3 players, PDAs, or other new high power devices
- Primary batteries growth forecast
  - 3 - 4% or 6 - 8% depending on how well primary developers respond to the high power challenge

# Consumer Trade-off Issues

---

- Historically 90% of consumers preferred primary
- By 2003 that number was down to 60 to 80% depending on the application
- Preference is sensitive to changes in relative performance
- **Consumer Issues**
  - **Primary availability convenience**
    - “All batteries die”
      - Primaries simplify carrying a back-up
      - Primaries simplify buying a back-up any time or any place
      - Sloping curve lets the device or an indicator provide a better warning
  - **Recharging inconvenience**
    - Fast chargers reduce this concern
      - But, consumers need <15 minutes to make it a non-issue
  - **Economics**
    - Rechargeable savings economics only appeals to a small portion of consumers
    - Irrational? **No!**
      - Consumer risk profile is “risk-averse”
      - Need a 6 month investment payout

# AAs in the Marketplace

- Standard Alkaline = 80 pulses
- High Power Alkaline = 125 pulses, 1.6X standard
- Nickel Oxy-hydroxide = 160 pulses, 2.0X standard
- Lithium Iron Disulfide = 570 pulses, 7.2X standard

In The Marketplace  
AA Digital Camera Pulse Test  
1.5 W 2s, .65W 28s, 10x/hr, Rest 55min, 1.05V

© RBC Technologies, 2006

# RBC HRB Products

---

- RBC's High Rate Bobbin (HRB) patent pending cell design is a hybrid between wound and bobbin cells

Top View of AA Cylindrical Cells

- Intermediate in:
  - Surface area between anode and cathode
  - Power
  - The manufacturing ease of bobbin and the complexity of wound
- Innovative manufacturing process closely based on conventional alkaline with similar low productions costs
- Pilot line in place to demonstrate high speed manufacturability

# RBC Performance

- HRB Alkaline:
  - 290 pulses, 3.7X performance vs. standard alkaline

© RBC Technologies, 2006

# RBC Performance

- **HRB Alkaline:**
  - 290 pulses, 1.7 Wh, 3.7X performance vs. standard alkaline
- **HRB Nickel Oxy-hydroxide:**
  - 430 pulses, 2.6 Wh, 5.5X performance vs. standard alkaline

**RBC Products**  
AA Digital Camera Pulse Test  
1.5 W 2s, .65W 28s, 10x/hr, Rest 55min, 1.05V

# What About Rechargeables?

- HRB Alkaline:
  - 290 pulses
- HRB Nickel Oxy-hydroxide:
  - 430 pulses

## Single cycle performance

- NiMH Rechargeable
  - 430 pulses
- Lilon Prismatic Rechargeable
  - 330 pulses (or 590 adjusted)

© RBC Technologies, 2006

# Cost & Value

- High power alkaline and Oxryde deliver comparable values vs. standard alkaline
- E2 lithium and both RBC products deliver superior values
  - RBC delivers value at close to alkaline price points

## High Power Primary

Performance, Cost, Value

AA Digital Camera Pulse Test

© RBC Technologies, 2006

# Values vs. Rechargeables

- Values for rechargeable products improve when cycles are considered
  - But...median digital camera pulses per consumer/year ~480
    - Almost double what film cameras were
  - Rechargeables don't make the 6 month payout for the median consumer
    - 2 to 5 years vs. primary products on the market
  - Vs. RBC HRB products: 5 to 8 years
- 1100 pulses are needed for your payback period to justify
  - Not most amateurs

The Recharging Investment

Rechargeable Payback by Picture Taking Usage

# Other Application Test Results

- Benchmarked to standard alkaline as 100%
- E2 Lithium and RBC Alkaline are superior products in all test ranges
- Nickel products provide good high power performance but sacrifice performance at lower power

ANSI/IEC Test Results

# Conclusion

---

## Primary batteries...

- **...have more life in them!**
  - Increasingly capable of high power that required rechargeables
  - Continued developments in design, chemistry and manufacturing processes are improving performance and values
- **...deliver consumer convenience, avoiding the investment and long payout for rechargeables**
- **...deliver design options for OEMs**
  - Lower price point at the point of sale
  - Ready to operate out of the box

## Challenge!

- **Incorporate the consumer into your design development process**
- **Talk to us about your needs!**
- **Talk to us about licensing!**

# High Power Primary

*It just might last longer than you think!*
