

The Liquid Color Adapter Plate (part# P2620) provides a port to inject liquid colorant over an existing mixing screw. The Adapter Plate consists of a 12x12x3/4-inch square with a 3-inch center hole and a 1/2-inch copper tube with a 90 degree bend. The plate is installed between the feed throat and the hopper. Mounting holes should be drilled on site to match the hopper bolt pattern. The delivery hose is inserted through the copper tube positioning the tube end in the forward portion of the throat and 1/2 to 1 inch directly over the down side of the screw.
