

EARCAP™

EAR IRRIGATION SYSTEM

- Large Volume
- Fast & Simple
- Less Mess Than Syringes

Use to Remove:

- Wax / Cerumen
- Foreign Bodies

EARCAP™

EAR IRRIGATION SYSTEM

- Large Volume Irrigation
- Built In Catch Basin
- Gravity Assisted Drainage
- Adjustable Flexible Eccentric Tubing
- Wide Comfort Brim & Backstop
- Universal Bottle Threads

Use the EarCap for flushing out wax and foreign bodies. The EarCap twists on any standard saline bottle for large volume irrigation. The built in catch basin collects draining fluid before it creates a mess, more work, and a wet uncomfortable patient. The positioning of the head tilted *downward*, uniquely works with gravity. Draining fluid and debris easily exits down and out of the ear canal. Place the patient next to a sink for self administration, saving your staff time and reducing their wait times. Avoid the tedious refilling of syringes with adapters that sometimes cause deep irritation or pressure. Avoid frightening patients with syringes which interfere with cooperation and success. Best of all, your progress can be monitored and rewarded, as your treasures plop into the transparent “see what you get” catch basin.

Always check fluid for appropriate warm temperature. Never use hot or cold fluids. Never irrigate if a tympanic membrane is suspected or known to be ruptured. The off-center nozzle allows a smaller shield to fit over ear. Orient shorter shield side forward. Use a new container or refill the original with clean tap water, as needed. Try the EarCap and “stick it in your ear!”

Purchase Just the Cap. Fits Any Standard Saline Bottle. Adjustable Depth Tubing. Tilted Position for Insertion and Gravity Drainage.

A Comfortable Alternative to Traditional Ear Irrigation

Use to Remove Wax / Cerumen & Foreign Bodies

Built-In Catch Basin
