The Houston Health Department has 2019-nCoV Real-Time RT-PCR testing available. Testing conducted by the Houston Health Department must have prior approval from the Epidemiology Program at a Houston area health department. Contact information for Houston area health departments is listed at the end of this document.

Testing is also available through commercial laboratories. Please contact commercial laboratories for details on test codes and ordering.

Specimens need to be collected by a doctor, clinic, or hospital, not the local health department.

Please do not send people to the Emergency Department for testing if they do not need emergency medical care.

**Interim Criteria to Guide Testing of Persons Under Investigation (PUIs) for Coronavirus Disease 2019 (COVID-19)**

Due to current testing capacity in Texas, public health laboratories in Texas, including Houston Health Department, will use the following criteria to prioritize testing of persons at risk for COVID-19.

<table>
<thead>
<tr>
<th>Clinical Features</th>
<th>&amp;</th>
<th>Epidemiologic Risk</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fever(^1) or signs/symptoms of lower respiratory illness (e.g., cough or shortness of breath).</td>
<td>AND</td>
<td>Any person, including health care workers(^2), who has had close contact(^2) with a laboratory-confirmed(^2) COVID-19 patient within 14 days of symptom onset.</td>
</tr>
<tr>
<td>Fever(^1) and signs/symptoms of a lower respiratory illness (e.g., cough or shortness of breath). Clinicians are strongly encouraged to test for other causes of respiratory illness (e.g., influenza).</td>
<td>AND</td>
<td>A history of travel from affected geographic areas(^3) (see below) within 14 days of symptom onset OR An individual(s) with risk factors that put them at high risk of poor outcomes(^6)</td>
</tr>
<tr>
<td>Fever(^1) and signs/symptoms of a lower respiratory illness (e.g., cough or shortness of breath) requiring hospitalization. Clinicians are strongly encouraged to test for other causes of respiratory illness (e.g., influenza).</td>
<td>AND</td>
<td>No source of exposure has been identified</td>
</tr>
</tbody>
</table>

---

\(^1\)Fever may be subjective or confirmed

\(^2\)For healthcare personnel, testing may be considered if there has been exposure to a person with suspected COVID-19 without laboratory confirmation. Because of their often extensive and close contact with vulnerable patients in healthcare settings, even mild signs and symptoms (e.g., sore throat) of COVID-19 should be evaluated among potentially exposed healthcare personnel. Additional information is available in CDC’s *Interim U.S. Guidance for Risk Assessment and Public Health Management of Healthcare Personnel with Potential Exposure in a Healthcare Setting to Patients with Coronavirus Disease 2019 (COVID-19)*.

\(^3\)Close contact is defined as—

- a) being within approximately 6 feet (2 meters) of a COVID-19 case for a prolonged period of time; close contact can occur while caring for, living with, visiting, or sharing a healthcare waiting area or room with a COVID-19 case
- or —
- b) having direct contact with infectious secretions of a COVID-19 case (e.g., being coughed on)
If such contact occurs while not wearing recommended personal protective equipment or PPE (e.g., gowns, gloves, NIOSH-certified disposable N95 respirator, eye protection), criteria for PUI consideration are met. Additional information is available in CDC’s updated Interim Infection Prevention and Control Recommendations for Patients with Confirmed COVID-19 or Persons Under Investigation for COVID-19 in Healthcare Settings.

Data to inform the definition of close contact are limited. Considerations when assessing close contact include the duration of exposure (e.g., longer exposure time likely increases exposure risk) and the clinical symptoms of the person with COVID-19 (e.g., coughing likely increases exposure risk as does exposure to a severely ill patient). Special consideration should be given to healthcare personnel exposed in healthcare settings as described in CDC’s Interim U.S. Guidance for Risk Assessment and Public Health Management of Healthcare Personnel with Potential Exposure in a Healthcare Setting to Patients with COVID-19.

Documentation of laboratory-confirmation of COVID-19 may not be possible for travelers or persons caring for COVID-19 patients in other countries.

Affected areas are defined as geographic regions where sustained community transmission has been identified. Relevant affected areas will be defined as a country with at least a CDC Level 2 Travel Health Notice. See all COVID-19 Travel Health Notices. It may also include geographic regions within the United States where documented community transmission has been identified.

Other symptomatic individuals such as older adults (age > 65 years) and individuals with chronic medical conditions and/or an immunocompromised state that may put them at higher risk for poor outcomes (e.g., diabetes, heart disease, receiving immunosuppressive medications, chronic lung disease, chronic kidney disease).

Specimen Collection Guidelines:

The Centers for Disease Control and Prevention (CDC) has updated specimen collection criteria to include combined NP/OP specimens as an option for upper respiratory specimen collection. This means that a nasopharyngeal and an oropharyngeal specimen are collected separately on two swabs and then both swabs are placed into the same viral transport media.

Infection Control Updates:

We would also like to draw your attention to the “Interim Infection Prevention and Control Recommendations for Patients with Suspected or Confirmed Coronavirus Disease 2019 (COVID-19) in Healthcare Settings,” by the CDC. You can reference the guidance https://www.cdc.gov/coronavirus/2019-ncov/infection-control/control-recommendations.html. For your convenience, a summary of the changes are provided below:

- Updated PPE guidance for the care of patients with known or suspected COVID-19:
  - To conserve respirators, facemasks can be used.
- Updated recommendations regarding need for an airborne infection isolation room (AIIR)
  - AIIRs are needed for aerosol-generating procedures only. Otherwise, a single-person room with a closed door may be used.

Additional Recommendations for Healthcare Providers:

1. Asymptomatic individuals should not be tested, it would have no clinical value or benefit to the patient.
2. We recommend testing for other, more common respiratory infections first. If you choose to test in an outpatient setting, then minimize that person’s time and exposures in the waiting room.
4. Once a patient tests positive, current practice in the U.S. is to obtain two consecutive negative tests at least 24 hours apart before ending self-isolation. Testing begins when a patient is symptom-free off medications for 24 hours.
5. Local health departments can provide clinicians with technical assistance at the numbers listed in the Houston Area Health Departments table at the end of this document.
6. The general public can call the Houston Health Department COVID-19 hotline with questions at (832) 393-4220, M-F 9 AM-7 PM, Sat-Sun 9 AM – 3 PM.
Houston Area Health Departments

Harris County Public Health
Telephone: (713) 439-6000
Fax: (713) 439-6366
