

Diesel fuel is a major cost component for Australian farmers. But where is it all used?

Until now the accurate allocation of fuel cost to a variety of trucks, farm machinery and cars was almost impossible. This also made it difficult to allocate fuel costs to certain farm activities (seeding, spraying, harvesting).

Smart Fuel Control provides the answer by introducing swipe card access to the diesel tank on your farm.

Allocation

Now each piece of machinery and each vehicle will have their own swipe card and every litre of fuel is automatically allocated.
