No question – No one is perfect.
And there are some things we can’t control – including bad luck…
But we can all strive to do better...

VF, Ventricular fibrillation; NA, not available.
*Other cities are listed in descending order by population density.
†Using Los Angeles survival as the reference.
Cardiac Arrest Survival
Cardiac Arrest Survival

PHENYCS
- repeat of PHASE
- post-merger (FDNY and EMS)
  - $$$
  - enhanced AED delivery
  - reduced response times
- year-long examination of OOHCA survival
- joint project: FDNY, NYAM, AHA
Cardiac Arrest Survival

PHENYCS Cardiac Arrest Study Results

- 134 victims of cardiac arrest were saved from April 2002 to March 2003
- Your chances of surviving a cardiac arrest in New York City increased 40% from 1990 figures

Survival rates increased due to:
- Reduction in response times by nearly 50%
- Implementation of first-responder defibrillation for 200 fire apparatus
- Doubled the amount of defibrillators available citywide
- Nearly doubled the amount of ambulance tours citywide

More CPR education needed in our communities

Cardiac Arrest is characterized by a complete loss of heart function.
Cardiac Arrest Survival

The reality:

THERE IS ALWAYS ROOM FOR IMPROVEMENT
Improving OOHCA Outcomes

2003 – 2006

- compressions-only pre-arrival instructions
- international trial of waveform-based AED algorithm
- adult AED use allowed for pediatrics
- 2005 AHA guidelines implemented
- supervisor response to every arrest
- Lyfetymer
- alternative airway
- vasopressin over epinephrine

Improving OOHCA Outcomes

But we can’t stop there…
MILD THERAPEUTIC HYPOTHERMIA TO IMPROVE THE NEUROLOGIC OUTCOME AFTER CARDIAC ARREST

THE HYPOTHERMIA AFTER CARDIAC ARREST STUDY GROUP*

INDUCED HYPOTHERMIA AFTER OUT-OF-HOSPITAL CARDIAC ARREST

TREATMENT OF COMATOSE SURVIVORS OF OUT-OF-HOSPITAL CARDIAC ARREST WITH INDUCED HYPOTHERMIA

STEPHEN A. BERNARD, M.B., B.S., TIMOTHY W. GRAY, M.B., B.S., MICHAEL D. BUIST, M.B., B.S.,
“Unconscious adult patients with spontaneous circulation after out-of-hospital VF cardiac arrest should be cooled to 32-34°C. Cooling should be started as soon as possible and continued for at least 12-24 hours.”

Improving OOHCA Outcomes

**Beneficial effects of hypothermia**

1. Preserve ATP stores.
2. Improve glucose utilization.
3. Mitigate neuronal calcium mobilization.
4. Reduce excitatory neurotransmitter release.
5. Reduce production of superoxide anions and attenuate free-radical damage.
6. Inhibit the accumulation of lipid peroxidation products.
7. Reduce production of NO.
8. Reduce lactate production and tissue acidosis.
9. Attenuate post-ischemic disturbances in CBF.
10. Reduce ICP.
11. Reduce amount of neutrophil migration into ischemic areas.
12. Reduce post-ischemic cytotoxic and vasogenic edema.
14. Accelerate expression of early genes hypothesized to participate in neuronal recovery.
15. Attenuate injury of microtubule-associated protein 2 needed for cross-linking of the neuronal cytoskeleton.
16. Protect fluidity of the plasma lipoprotein membranes.
Improving OOHCA Outcomes

Barriers / Considerations for EMS in NYC
- large number of providers (~900 paramedics just within FDNY)
- paralytics are currently not utilized
- short transport times
- temperatures are currently not checked
- currently lacking waveform capnography
- lacking refrigerators
- issue of whether hypothermia would be continued in the hospital

Alternatives for EMS in NYC to Consider
- EMS Officer utilization
  - still presents above issues
  - not all supervisors are paramedics
- Selective transport to hypothermia centers
Improving OOHCA Outcomes

Proposal #1: Beginning July 1, 2008, all OOHCA patients achieving ROSC in New York City will only be transported to facilities actively employing therapeutic hypothermia.
Improving OOHCA Outcomes

Proposal #2
Beginning January 1, 2009, the treatment for all OOHCA patients in New York City will include the induction of therapeutic hypothermia during the first minutes of the resuscitation.
But how?
Avoiding the cold shoulder

1. Make this a partnership to improve outcomes.
   - recognize that none of us work in isolation
   - be willing to give credit
   - work constructively, not critically
Avoiding the cold shoulder

2. Involve the players in the game plan from the beginning.

- ICU Directors
- ED Directors
- CEOs
- Regional oversight
- State oversight
- hospital corporations
- DOH
- (IRB)
Avoiding the cold shoulder

3. Take ownership without implementing a dictatorship.
   - don’t force it down their throats
   - provide a framework, but be willing to compromise
Avoiding the cold shoulder

4. Ensure a two-way exchange of data.
Avoiding the cold shoulder

5. Keep your personnel interested and informed.
Avoiding the cold shoulder

6. Most importantly - always keep your eye on the ball.
Thank you.
