

SECURING A NETWORK

The Problem

TRA have been coming across suspicious activity on their network and felt their systems were not secured. They were using simple passwords authenticate across all their systems. Their priority was to secure their Windows Desktop computers and network devices for all of their 300 users.

The Solution

Authlogics suggested using their Multifactor Authentication solution. Authlogics MFA solution provides four different types of MFA technologies which can provide risk appropriate authentication. Using Authlogics's Windows Desktop Logon agent and PINGRID technology they have managed to secure their Windows workstation.

They now also authenticate into their network equipment using the built-in RADIUS server in the Authlogics Authentication Server.

TRA being the regulatory authority is also planning encourage the local telecommunication provider to use Authlogics's Two-Way Identity solution to prevent identity theft.
