Roster Management System

Roster Scheduling and Personnel Management System

For Police, Fire and EMS

Plan for the future with the Roster Scheduler!

The management of available resources is the most complicated procedure with any public safety agency. Who's on, off, available, re-assigned, on vacation, or sick on any given day of the year. The solution is to eliminate the guesswork associated with scheduling of personnel and resources.

This Roster Management System is designed to schedule any number of divisions, each with their own specific rotations/shifts. Flexible definitions of work group rotations are defined by each agency including 4 on/2 off, 24 hour shifts, overlapping shifts and many others. Customized work codes and accrual categories for exceptions to schedules (vacations, sick, swaps, personal days, etc) define one of the many attributes of the system.

Each station commander can update with schedule with last minute personnel availability changes, and submit a final

schedule at the end of the shift. All stations roll up to a master HQ schedule. The schedules display how many persons are on-duty for that shift and present and on future dates. Advance vacation scheduling automatically integrates vacation time into the schedules. All the various time categories are tracked and calculated. For example, taken vacation days are subtracted from the accrued vacation days. A report of actual vacation days taken and accrued is immediately available in the case of a dispute.

Past schedules are archived for perfect record keeping.

All past schedules are locked and archived and can always be retrieved when needed at some future date. There should never be a question of when someone worked, what apparatus they were assigned to.

Auto-populate run reports and NIBRS reports.

Personnel and assignments flow automatically to written reports.
